OSS - Operation Support Systems

Enhance operation efficiency

OSS provides tools to automate and monitor network operation procedures, from implementation, configuration to monitoring and risk management, which helps enhance operation efficiency and minimize errors.

Support multiple network vendor management

For service providers with multiple networks and complex infrastructures, OSS helps manage multi-vendor networks efficiently, from data integration to resources and services management across different networks.

Resource Optimization

OSS helps organizations optimize the use of network resources, including bandwidth, capacity and other infrastructure resources. This can help reduce operating expenses and optimize service capacity.

Support chain supply management

OSS provides tools to manage and track the entire process from ordering, implementation, operation to maintenance and cancellation of services. This helps optimize supply chain procedure and enhance management efficiency.

Enhance customer experience

By helping organizations detect and resolve network problems quickly and effectively, OSS can improve customer experience through minimizing service interruption time and guarantee better service quality.

Technology

Architecture: Microservice, Monolithich, BigData

Back End: Spring Boot, Scala, Java

Front End: Angular, ReactJS

Database: MariaDB, Oracle, MySQL, Hive

▪ Viettel Network (VNet)

▪ Metfone (Cambodia)

▪ Unitel (Laos)

▪ Mytel (Myanmar)

Customer

▪ Telemor (Timor-Leste)

▪ Natcom (Haiti)

▪ Lumitel (Burundi)

▪ Bitel (Peru)

Features

Smart infrastructure management

- Manage network infrastructure
- Manage network productivity
- Monitor IT infrastructure
- Manage network configuration
- Smart electromechanic and electromechanic management
- Manage natural disaster prevention

Operation management

- Manage and operate centralized network
- Manage technical implementation & mobile versions
- Management system of network infrastructure maintenance
- Monitor and alert network element and IT
- Monitor and alert telecommunications network and IP
- Manage information on impact account

Automatic impact management

- Automatic network impact software - Mobile
- Automatic network impact software - IP Core
- Automatic network impact software - IT
- Automatic network optimization system
- Automated troubleshooting system

Data analysis management

- Manage and monitor network impact
- Service operation management centre (auto-data, network optimization)
- Data roaming quality monitoring system

Solutions for new products and services

- Digital platforms for organizations, businesses
- Interactive chatbot/callbot (Support exploitation operation)
- Automatic service checklist management system
- Automatic maintenance and defect report images monitoring system

Product

BSS - Business Support Systems

BSS 2.0 is Viettel's backbone software system that manages all activities from sales resources, product policies, customers, customer care, to the entire system of reporting (in Mobile, Fixed, ICT Solution fields...).

Features

Product Management System (BSS_Product)

System for declaring product categories: resources (subscribers, SIM cards, handsets,...); products; product characteristics.

Fee Payment System (BSS_Payment)

System for managing fee collection, invoice management, management of revenue streams, management of partner commission calculations.

Customer Care System (BSS_CC)

System providing customer information solutions (lookup, response to customer requests) and supporting complaint resolution (Call Center, NOC, Billing,...).

Customer Management System (BSS_CM)

Profile management system, customer information management, order placement, deployment process, and service interface management.

Sales Resource Management (BSS_IM)

Resource management allowing users to manage warehouse inventory, invoice management, number management, and infrastructure management.

Reporting System (BSS_Report)

Tracking sales transactions; warehouse, inventory, invoice transactions; tracking complaints in the customer care system.

Benefits

Sales Support and Customer Care

- Fulfill all sales and customer care operations.
- Manage approximately 90 million customers with 2.5-3 million transactions per month, customer support volume across - phone/SMS/Chat channels averaging around 15 million per month.

Centralized Data Management

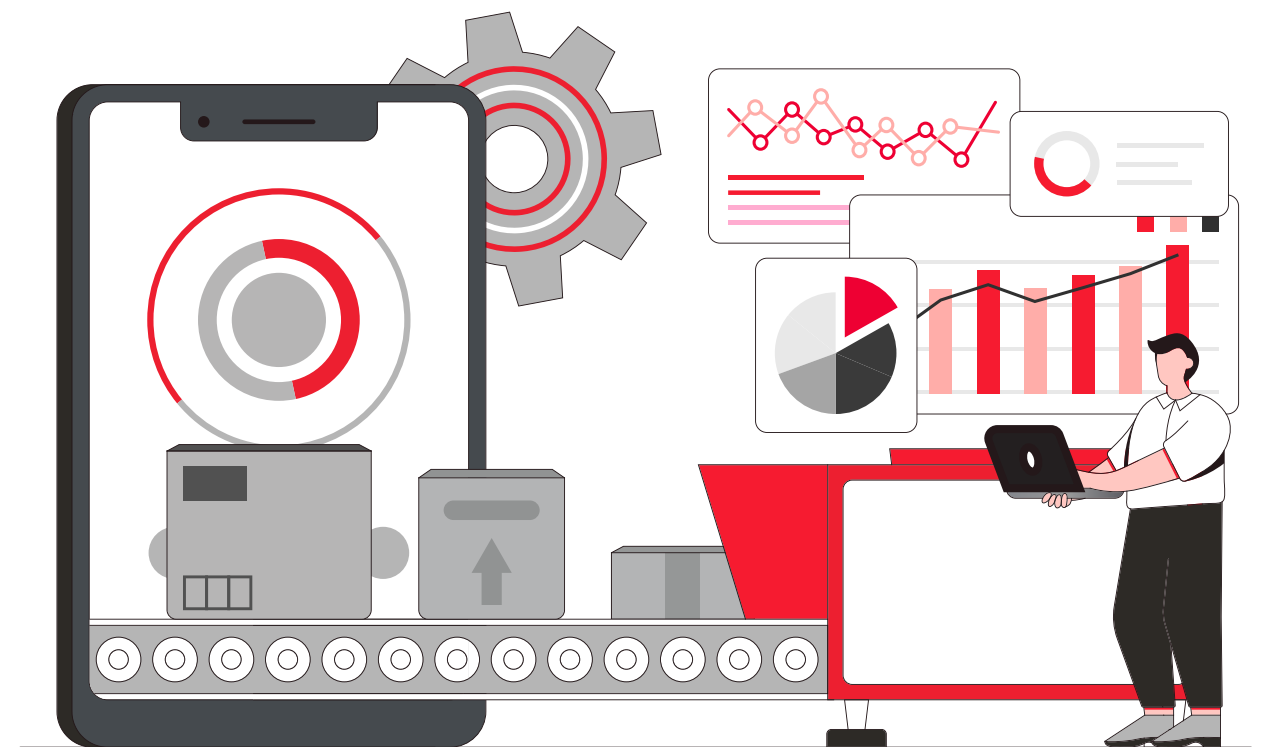

- Centralize data management of approximately 90 million customers, the entire transaction history (over 14,000 trillion revenue generated from sales transactions through the system each month), approximately 10,000 service products (packages, VAS...), 120,000 sales channels.

Cost Optimization

- Optimize labor costs by transferring tasks from Viettel Telecom to freelance forces through the mBCCS system.
- Have a diverse customer database to serve Viettel's product ecosystem.

Increasing Operational Efficiency

- Automate customer interactions through the system.
- Multichannel interaction with customers (phone, chat, email, messaging, social media,...)
- Proactively introduce products, services tailored to each customer.

RMS - Risk Management System

Identify and assess risks

RMS helps businesses identify and assess potential risks related to their activities. This helps organizations identify risks that may affect business goals and prepare response plans.

Effective risk management

RMS provides tools and processes to manage and minimize risk. By establishing strategies and preventive measures, businesses can minimize negative impact and optimize opportunities.

Enhance flexibility and quick reaction

RMS allows businesses to boost flexibility and respond quickly to unexpected fluctuations and risks. By implementing flexible response plans, organizations can adapt and adjust quickly when necessary.

Benefits

Enhance Predictability

RMS allows businesses to boost flexibility and respond quickly to unexpected fluctuations and risks. By implementing flexible response plans, organizations can adapt and adjust quickly when necessary.

Enhance the trust of shareholders and partners

By demonstrating professional and risk management capabilities, businesses strengthen the trust among shareholders, partners and customers. This can create favorable conditions for attracting investment and expanding business collaboration.

Technology

Architecture: Microservice, Monolithich, BigData

Back End: Spring Boot, Scala, Java

Front End: Angular, ReactJS

Database: MariaDB, Oracle, MySQL, Hive

Customer

- Viettel Global

Features

Target and strategy category

Declare, update, and store all the monthly/quarterly/yearly targets and strategies.

Risk information library

Entire information about risk scenarios, encounters, fields and targets that can effect risk

Loss management

information about losses, fields, time, loss value, loss description and confirmation of the organization.

Lessons learned

Summarize information of lessons learned, approved, updated, and revised.

Risk management

Manage risks that are approved and set up. Allow identification, evaluation, planning and update.

Key risk indicator (KRI)

Manage declaration of KRI indicators, formulas, measurement frequency, and warning thresholds (Green, Yellow, Red)

Dashboard and risk report

Shows distribution, quantity, risk status, level, heat map for monitoring and reporting.

References, training

The feature allows organizations to proactively update policy information, guidance documents, and share knowledge.

VAS - Value Added Services

Typical project: My Clip

*My Clip is a video social media which allows user to upload, share and comment on videos.
This is the first and exclusive video social media of Vietnam.*

Features

- Watch online videos
- Upload videos
- Watch short videos
- Interact (comment, share, like) with uploaded videos
- Livestream
- Karaoke, singing with celebrities
- Watch online movies
- Purchase data package
- Income for content creators on My Clip

Benefits

Share and connect

My Clip allows users to share videos, photos, and other multimedia content with friends, family and online communities. This creates opportunities to connect and communicate with others who have similar interests.

Entertain and relax

Users can utilize My Clip to watch and search for entertaining, funny or useful videos from diverse sources. This helps them entertain and relax after a stressful workday.

Create content and experience

My Clip provides tools for users to create and edit videos which allows them to express their creativity and develop their video-making skills. This can bring enjoyable experiences for users.

Join in communities

My Clip offers an opportunity to engage with individuals who share the same interests and viewpoints in virtual communities. Users can participate in social media groups, forums or events to share their opinions, experiences and interests.

Update trend and information

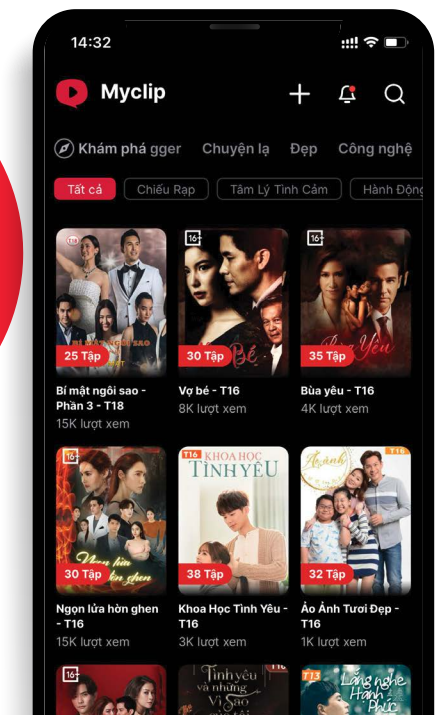

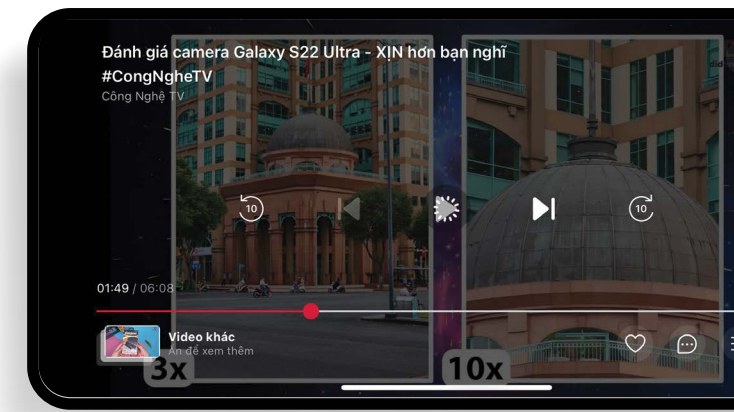

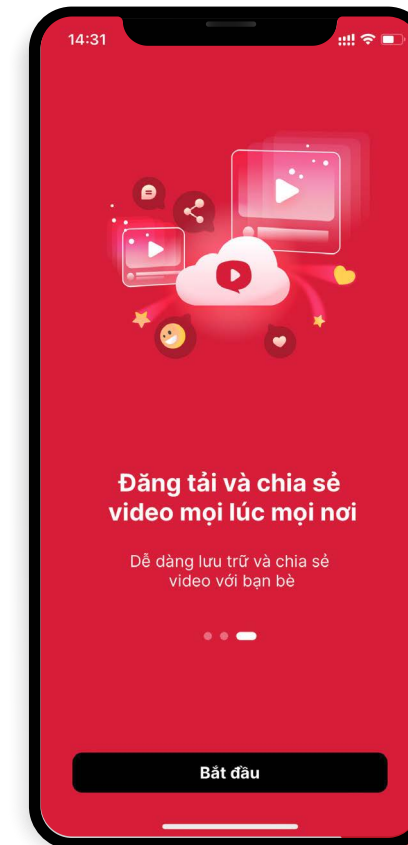

My Clip gives users a way to stay up to date with information and trends from writers, artists, and other users on the internet.

BIG DATA

Typical project: Viettel Data Platform

Features

Technology

Technology: Hadoop, Spark, Kafka
 Language: Python, Scala, Java
 Framework: Viettel Data Platform
 Tool: Jira/ Confluence
 Method: Agile Scrum

Benefits

Consulting & deploying Data Lake for businesses with the most advanced technology platform.

Effective data analysis

Viettel Data Platform provides tools and advanced data analytics technologies that helps organizations understand their data better and generate important insights from it.

Effective data management

The system help organizations arrange and manage data more productively, from collecting, storing to troubleshooting and securing data.

Optimize business processes

Using data to optimize business processes, from marketing to manufacturing and customer service, help organizations save costs and increase productivity.

Forecast and assess on data basis

Viettel Data Platform can help forecast future trends, and assess the efficiency of strategies and decisions on data basis.

Enhance customer experience

By analyzing customer data, Viettel Data Platform can help businesses understand customer demands and needs, thereby improving their experience.

Data security

System provides advanced security solutions to guarantee the safety of organization's data.

Product

CALLBOT - CHATBOT

Typical project: Viettel Cyber Bot

Benefits

Callbots & Chatbots are important parts of a business development strategy, helping to optimize operational efficiency and improve customer experience.

- **Enhance customer access**
Reach a large number of customers automatically and continuously, helping to expand marketing scope and reach new customers.
- **Maintain 24/7 support**
By deploying bots, businesses can provide support to customers 24/7 without having to recruit staff to work night or weekend shifts, helping to increase customer satisfaction and reduce waiting time.
- **Cost optimization**
Minimize labor costs and operating costs. Especially in the case of callbots, call automation can reduce phone communication costs for businesses.
- **Handling batches of queries**
Bots can handle batches of queries from customers quickly and effectively, helping to minimize response time and increase work efficiency.
- **Enhance customer experience**
By providing quick and automated services, bots help improve customer experience, from answering questions to handling support requests.
- **Data collection and instant response**
Callbots and chatbots can collect data from conversations with customers and provide instant responses, helping businesses better understand customer needs.
- **Easy integration**
Bots can be easily integrated into a business's existing systems, from websites, mobile applications to CRM systems and other management tools.

Features

Applying the best Vietnamese voice and conversation processing technologies, Viettel Cyberbot is a platform to help businesses build automatic switchboard systems through Callbot and Chatbot. Viettel Cyberbot interacts with customers friendly and naturally, helping businesses transform digitally and optimize customer care resources.

Multi-platform integration of Call Center, Web, App, Messenger, Zalo

Manage call and chat history, automatically extract important information

Manage and train Bot knowledge quickly

Integrate and connect with the bank's information system

Build bots, scripts, diverse reply campaigns

Visual statistical reporting and analysis

Advantage

Interaction, proactive customer service

Integration with systems, allowing to capture triggers to proactively take care of customers (error transactions, missed calls, upsells).

Implementing high-speed calling campaigns

Viettel's solution is optimized for performance, allowing for high-speed calling campaigns with tight deadlines that operators cannot meet.

Diverse natural voices

Allows to choose from a variety of bot voices, customized according to the characteristics of specific customer and customer service campaigns

New AI technology (ChatGPT)

Master AI technology, allowing customization for specific problems and operations. Viettel bot v2.0 will be integrated with Large Language Model technology, which allows natural and flexible communication.

SUPER APP/ PORTAL

OUR CASE STUDY: MY VIETTEL

My Viettel is the most convenient utility application currently to manage, look up, and register the 3G/4G package when using Viettel network. The product is synchronized on all web, smartphone, and tablet platforms.

Benefits

Enhance customer experience

My Viettel offers many utilities and benefits to customers by providing account management services, bill payment, notifications and incentives, and customer support, helping them have a better experience of Viettel service in a convenient and time-saving way.

Cost efficient

My Viettel helps users save expenses by:

Manage data pack: Inspect and select the appropriate data pack that meets user needs, users can avoid paying extra fees for unnecessary features and services.

Incentive notification: By receiving notifications about the newest incentive, users can take advantage of cost-saving chances and obtain intriguing incentives.

Convenient payment: My Viettel allows users to pay bills easily through the app from anywhere, which avoids time-consuming and travel expenses to stores and transaction points.

Information security

My Viettel not only provides functions and technology to secure the confidential information of users effectively but also complies with regulations about information security and privacy

Outstanding functions

User management

including functions such as checking account information, changing account information, standardizing information, checking fees, and registering data package.

Top up card, pay bill

- Top up card: Allows users to purchase phone cards, data cards for themselves or other subscribers.
- Pay bill: Pay all Viettel's telecommunication services such as Internet, TV,...

Viettel++ point accumulation

This exclusive function allows Viettel's customers to earn points when using services and redeem points to get special incentives.

Partnership service

Connect to a variety of services from many leading partners in

- Shopping: Shopee, Lazada
- Education: ELSA SPEAK, Monkey Junior, VMonkey
- Banking & financial services: Fast Money, SHBFinance, FE credit

Shopping

Provide external telecommunication services: game payment, Vietlot lottery, buying cheap bus tickets, plane tickets, hotel reservations, MIC insurance...

Entertainment

Integrate products from Viettel ecosystem such as Imuzik, Myclip. In addition, combining many categories like news, minigames and intriguing movies.

Customer support

Users can video call the customer care switchboard to ask for any support.

EAS - Enterprise Administration System (NonSAP)

EAS is an enterprise management system that includes satellite operations integrated with core enterprise systems (for example, enterprise resource planning systems, customer management systems, etc.).

Benefits

Solving business problems

problems that cannot be solved on other SAP/CORE ERP systems will be handled on the EAS system.

Centralized data management

Data from integrated subsystems will be synchronized and managed on the EAS system.

Be proactive in handling work

Users can process and synthesize data easily and quickly.

Increase interaction efficiency

All departments can interact on the EAS system. Increase flexibility and efficiency in the process of coordinating work handling

Technology

Architecture: Microservices
Back End: Java, Spring Boot 2
Front End: Angular 13
Database: PostgreSQL

Customer

Large businesses and organizations deploying core ERP systems such as SAP and Oracle need to integrate satellite business systems, because core ERP cannot meet all needs.

Businesses have been, are, or will be implementing core ERP solutions and have a need to integrate satellite business systems.

Customer

Viettel Commerce

Features

Purchase

- Manage purchase order list and delivery schedule
- Manage invoices and supplier debts
- Manage import and return goods
- Management reporting system as required

Sales

- Manage order, price policy, debt policy
- Manage delivery, issue invoice
- Manage return, discount,...
- Manage customer debt, administrator reports

Warehouse

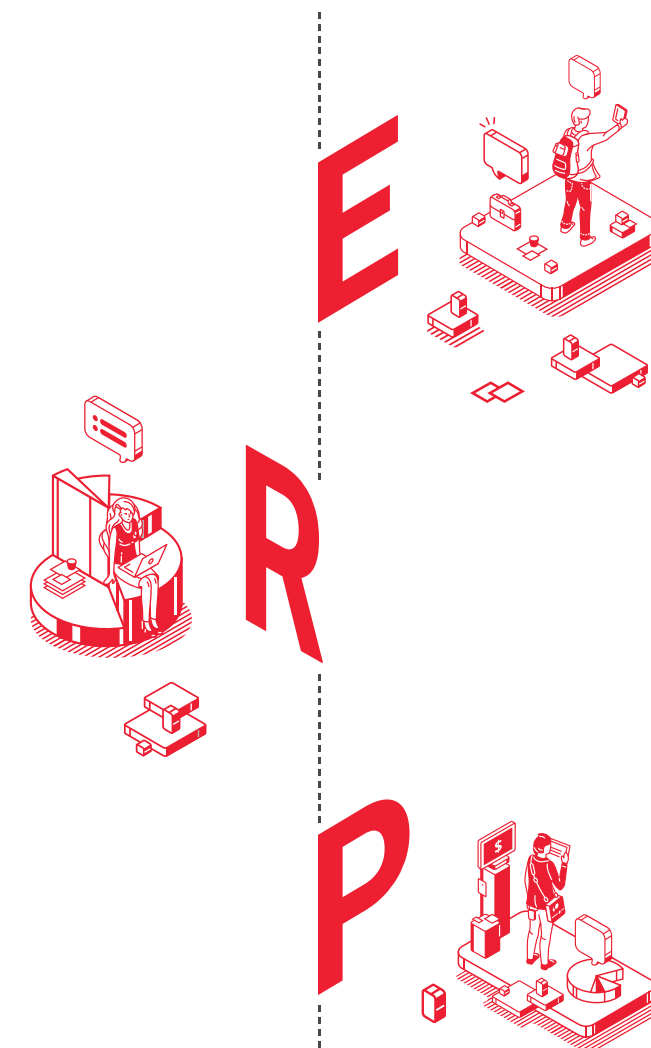

- Manage import, export, and warehouse transfer
- Adjust inventory
- Manage deliveries through shipping channels

Accountant

- Accounting transactions
- Management of revenue and expenditure, expenses, advances and refunds
- Asset management
- Transfer data
- Management reports, reports according to regime circulars

Guarantee

- Warranty with suppliers.
- Warranty with customers (end users, dealers).

Product

MES - Manufacturing Execution System

Benefits

Increase productivity

- Reduce unnecessary processes by **31%**
- Average reduction of **75%** in time spent on data collection, input, and storage due to automation of most tasks.
- **56%** decrease in manual work, paperwork, and complex procedures through digitization of processes.
- **18%** decrease in product defects due to standardized processes.
- **20%** increase in machinery efficiency due to optimal maintenance planning.

Reduce cost

- Reduce labor cost by **25%** because some jobs are performed instead by computers.
- Reduce material cost by **31%** because resources are always planned for optimal use

E-wallet satellite system

Features

AM	- Channel management: manage channel models, create, update, deactivate channels. - Sys user management: manage system user accounts. - Funding management: manage fund reception, reception of cryptocurrency funds, cash fund reception, withdrawal. - Report: manage reports, channel reports, commission reports, transaction history reports. - Payment Management: create batch money transfer transactions.
AML (Anti-Money Laundering)	- Customer management: view customer information, search customer information. - Transaction management: view transaction information, transaction details. - Blacklist management: search, create, view blacklist details. - Alert management: view, search, create transaction alert cases. - Scenario management: manage scenario settings for transaction evaluation, scenario settings for blacklist scanning rules. - Report management: view reports, export reports. - Configuration management: system configuration management.
Merchant	- Register merchant: register for a merchant. - Order list: merchants view order lists. - Create orders. - Payment for orders. - Transaction: view transaction information.
Loyalty	- Reward Point Policy Configuration: configure reward point policies. - Manage Promotion Program: manage advertising programs, add, edit, delete programs. - Loyalty: manage customer points, ranks, loyalty levels. - My Rewards: manage rewards, voucher redemption.
Reconcile	- Automatic reconciliation process: automatically pull data from partners internally for reconciliation and perform reconciliation on each record. - Post-reconciliation status update process: update system record statuses if discrepancies are found compared to partner records. - Refund process after reconciliation: refund customers after reconciliation. - Post-reconciliation processing result synchronization process: synchronize system and partner processing results after reconciliation completion.

Technology

Architecture: Microservices
Back End: Java, Spring Boot 2
Front End: NodeJs
Database: Oracle

Benefits

Benefits for service providers:

- Tools for managing agents and electronic wallet channel models.
- Ability to fund channels to entities within the channel model.
- Access to various statistical reports showing business model development indices.

Benefits for Channels:

- Tools for managing subordinate channel entities and channel staff.
- Reporting tools for tracking channel and sub-agent development progress.
- Tools for direct funding with entities within the managed channel branch.

Benefits for service providers:

- Control over transaction flows, customer risks.
- Evaluation of scores according to specified values.
- Timely alerts.
- Comprehensive case monitoring for streamlined supervision.

Benefits for state banks:

- Protect the financial system
- Maintain reputation
- Comply with the law
- Coping with risks

Benefits for service providers:

- Attract merchants to join the system to build sales channels
- Attract end customers to participate in shopping and consumption, build accumulated points, and retain loyal customers who regularly use the service.

Benefits for Merchants:

- Access to end customers.
- Tools for managing sales, directly introducing products to end customers.
- Manage vouchers and store promotions.

Benefits for service providers:

- Helps manage customer loyalty.
- Manage promotions for customers.
- System for assessing loyal customers and attracting customers to use wallet services.

Benefits for Merchants:

- System for managing vouchers, issuing promotional programs.

Benefits for service providers:

- Automate the reconciliation process, reducing the load of resources involved in daily reconciliation work. The accuracy of cross-checked and post-checked data is higher than manual check forms.
- Automatically process after performing data comparison, helping to promptly handle customer complaints.

Benefits for partners:

- Reduce time working with partners to obtain data for control.
- Partner data is synchronized with system data after successful reconciliation.

Digital Banking

Features

Digital Banking for Individuals

1. Money Transfer - Gifting

Transfer money inside/outside the bank, by account number, card, phone number, send gifts - cards, lucky money individually/in batches...

2. Cash withdrawal

Withdraw money via ATM, at affiliated store channels such as Viettelpost, VNPost...

3. Link money sources

Linking money sources such as ATM cards and e-wallets to top up account balance.

4. Pay bills

Link service providers, allow QR payments, household bills (electricity/water/internet/television/mobile...), public service (taxes/tuition/social insurance/non-stop vehicle fees ...), entertainment - travel (movie tickets, train tickets, plane tickets, hotels, travel tours...)

5. Credit functions

Linking financial partners allows buying insurance, linking securities, types of loans (consumer loans, real estate...), recharging agents (air tickets, insurance), loan registration for customers...

Deposit fixed interest savings, cumulative digital deposits...

6. Card management

Issuing online cards, beneficiary cards, activating/locking/unlocking various types of cards, credit card installment payments, history queries...

7. Account management

Open/identify an eKYC online account, register a beautiful account number, share dynamic information, manage account information, passwords, change application themes...

8. New technology

eKYC, Smart OTP, Chatbot AI, Cross Platform...

Digital Banking for Businesses

1. Intra/Interbank Money Transfer: Single/Batch transfers; payroll, scheduling...

2. E-form money transfer: MISA, FAST money transfer...

3. Payment - QR Pay - Taxes

4. International payment: Create drafts, money transfer forms, add documents, query, reconciliation...

5. Credit: Online disbursement, Online guarantee, loan payment, deposit..

6. Buying and selling - Currency Exchange

7. Manage branch/subsidiary accounts

8. Sub-account management

9. Manage card and electronic invoice services

10. Query - Tracing - Reconciliation: Query, tracing, reconciliation according to each type of transaction

11. Statistical analysis report

12. General configuration management: Set up approval flow, digital signature, Authentication method (SMS OTP, SmartOT...)...

13. Management CMS module for Bank: Business account management, campaign management, statistical analysis reports, multi-channel support Chatbot

14. New technology - Utilities: eKYC, OCR, remote digital signature, Smart OTP Chatbot, Big Data, Cross Platform, access via web/mobile app...

Technology

Architecture: Microservices

Language: Java, ReactJS, Angular

Framework: Spring Boot

Tool: Jira/ Git/ Confluence

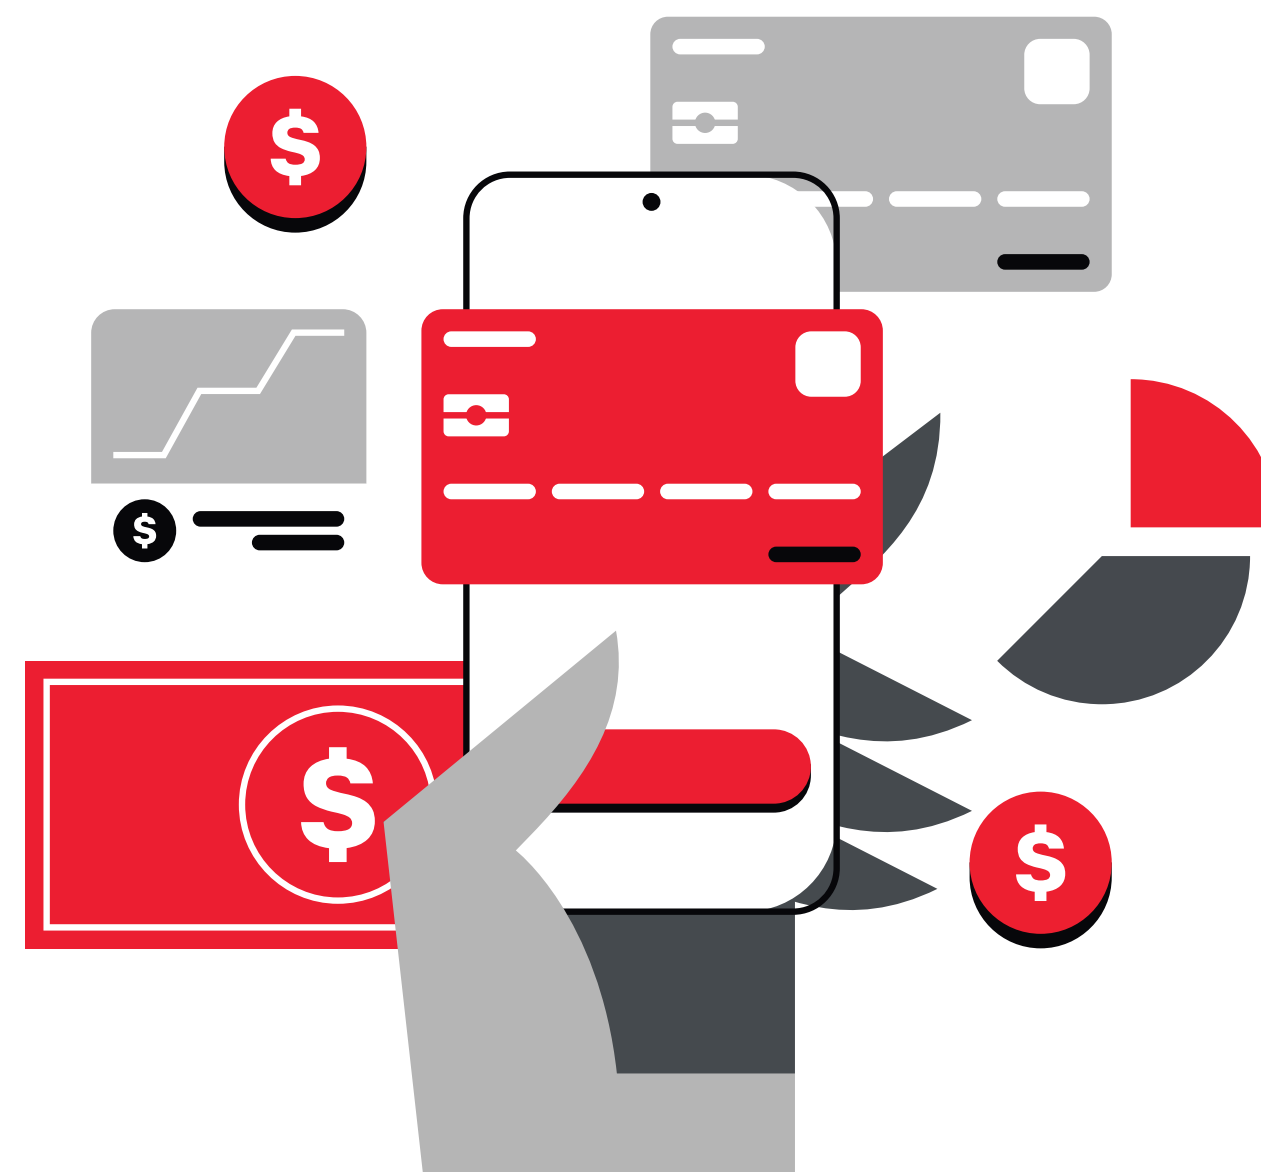

Benefits

Benefits for customers (Individuals / Businesses)

Register account and perform online banking transactions quickly, safely and conveniently.

Benefits for banks:

Digitizing the entire process as well as banking transactions, from new registration/identification/locking/unlocking accounts, to banking transactions such as money transfers, payroll, payments, taxes, etc., helps enhance customer experience and loyalty, making it easy to access and attract more new customers, while reducing time, fixed costs, and optimizing support administration systems to improve operational efficiency.

BFSI – BANKING, FINANCIAL SERVICES AND INSURANCE

Product

Payment gateway

Features

1

Accept multiple Payment methods

Allow using many sources of money for payment: bank account, ATM, credit card, e-wallet,..

2

Many payment authentication methods

Authentication via SMS OTP, Smart OTP, 2-layer authentication for each transaction or session token helps customers authenticate quickly and securely.

3

Portal for partners - service providers

Manage service policies, track transaction history. Make refund/cancellation requests, check and reconcile transactions.

4

Administration portal

Manage connection partner configuration, refund/cancellation policies, campaign programs...
Track transaction management by each partner, receive and process refunds/cancellations, check and reconcile transactions.

5

Reconciliation – Reporting – Analysis report

Perform transaction synchronization and automatic checking and reconciliation. Applying Big Data technology to produce transaction analysis reports and business forecasts for parties.

6

Support for multiple integration forms

Allow integration via webview, API

Technology

Architecture: Microservices
Language: Java, ReactJS, Angular
Framework: Spring Boot
Tool: Jira/ Git/ Confluence

Benefits

Benefits for Buyers

Utilize multiple funding sources for convenient, safe, and fast payments anytime, anywhere.

Benefits for Service Providers - Sellers

Optimize profits, increase sales revenue.

Quickly, directly, and accurately collect payments.

Minimize risks such as order cancellations, unsuccessful COD shipping orders

Manage transaction history, avoid confusion in the payment process.

Enhance customer satisfaction, thus increasing purchase rates and repeat purchase rates.

Reach potential customers, enhance the competitiveness of the business in the market.

Benefits for Financial Organizations (Banks, E-wallets)

Help their customers easily use funds to complete transactions across various applications, platforms.

Maintain and attract more customers.

BFSI – BANKING, FINANCIAL SERVICES AND INSURANCE

Product

Credit Gateway - Loan Gateway

Look up information about loan services

Users search and look up information about services and loan packages such as conditions, line of credits, interest rates...

Register / disburse / settle the loan

- Register for suitable loans (cash loan, salary advance loan, real estate purchase loan...).
- Credit institutions carry out disbursement
- Manage, look up and pay loans

Portal for partners to manage transactions

Manage service policies, track transaction history. Request refund/cancel, check and reconcile transactions

Administration portal

Manage connection partner configuration, refund/cancellation policies, campaign programs... Monitor transaction management by each partner, receive and perform refunds/cancellations, check and reconcile transactions

New technology

eKYC, OCR, RPA (process automation), Big Data...

Support for multiple integration forms

Allow integration via webview, API

Reconciliation – Reporting – Analysis report

Perform transaction synchronization and automatic checking and reconciliation. Applying Big Data technology to produce transaction analysis reports and business forecasts for parties

Technology

Architecture: Microservices

Language: Java, ReactJS, Angular

Framework: Spring Boot

Tool: Jira/ Git/ Confluence

Benefits for end users (borrowers)

Easy Access: Users can easily access and retrieve information about various loan services (cash loans, salary advances, real estate purchases, etc.) from different providers, allowing them to choose the most suitable loan quickly and easily.

Benefits for credit institutions

Expanded Access: Lending organizations can expand their lending channels through various partners, intermediary financial institutions, e-wallets, banks, etc., thereby reaching and attracting a large number of customers.

Benefits for intermediary financial institutions

Diverse Service Offerings: Intermediary financial institutions can provide a variety of loan products and services to end customers, attracting and expanding their customer base, thus increasing revenue and profits.
